

Microsoft Office SharePoint

Microsoft Office SharePoint Server 2007 allows people and teams to connect and collaborate. It creates a single location where users can find organisational resources, search for experts and corporate information, manage content and workflow, and draw on your accumulated business insight to make better informed decisions.

The technology - as with all Microsoft products - is easy to use, implement and maintain.

Key Features:

- Reduced costs on complex IT
- Connects people to key business applications
- Microsoft Office Excel-based business intelligence
- Efficiently manages multiple websites

SharePoint supports all intranet, extranet, and web applications across a business within one integrated platform, instead of relying on separate fragmented systems.

Additionally, this collaboration and content management server provides IT professionals and developers with the platform and tools they need for server administration, application extensibility, and intergration.
